

Biodigital Convergence

The Biodigital Convergence is the merging of biological systems with digital technology. It involves:

Changing human beings - our bodies, minds, and behaviors.

These nanomachines have the ability to track, trace, monitor, as well as send and receive information, including instructions. They also have the capability to alter the human body.

Changing and creating other organisms

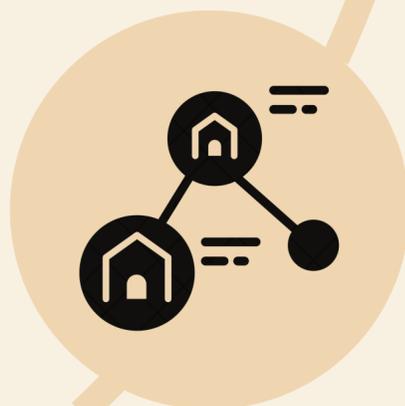

The Biodigital Convergence involves the absorption of synthetic microscopic nanomachines into the human body from food, plants, air, water, soil, and everything around you.

The Biodigital Convergence

SMART cities

The Biodigital Convergence is dependent on the building of Smart City infrastructure and the digital prison that comes with it. Things like Digital Twin technology, Metaverse, Blockchain, Digital ID and other aspects of the Smart City are the strings that connect YOU to THEM. Like a marionette puppet is connected by strings to its master, the wireless signals connect the body to the network.

What can we do?

All this brings major human rights violations, major health concerns, and major cyber security risks. Find out what you can do to stop this before it's too late! Arm yourself with the ability to confront your local leaders about these agendas they're rolling out.
